#### The Benefits of Trade for Developing Countries

### The economics are clear: trade liberalization, combined with pro-market, developmental domestic reforms, enhances the economic growth potential of developing countries.

- The World Bank has reported that per capita real income grew nearly three times faster for developing countries that lowered trade barriers more (5.0 percent per year) than other developing countries (1.4 percent per year) in the 1990s.
- Trade liberalization and domestic reforms go hand in hand. Studies show that openness is linked to key macroeconomic and governance policies that enhance growth.

### Developing countries are potentially large beneficiaries of an ambitious outcome to the Doha Round of WTO negotiations.

- According to a World Bank study, roughly half of global economic benefit from free trade (goods only) would be enjoyed by developing countries. The estimates for the increase in developing countries annual income by 2015 are:
  - Static measurement \$142 billion of \$287 billion (49 percent)
  - Dynamic measurement \$259 billion of \$461 billion (56 percent)
- Developing countries would receive nearly two-thirds (63 percent) of the potential benefits of eliminating agriculture distortions (tariffs and trade-distorting subsidies) by developing and developed countries.

#### The benefits for development lie in a strong market access outcome.

• Modeling by World Bank economists indicates that 93 percent of the global welfare gains (and for developing countries, virtually all of the gain) from removing distortions to agricultural trade globally would come from reducing import tariffs, while only 2 percent is due to export subsidies and 5 percent to domestic support measures.

#### Development benefits are reduced if flexibilities operate to erode ambition.

• The same modeling by World Bank economists shows that the welfare gains from global agricultural reform would shrink by three-quarters, if as little as 2 percent of agricultural tariffs in developed countries (and 4 percent in developing countries,) are classified as sensitive, and are thereby subject to a 15 percent tariff cut.

#### Trade is a powerful tool to generate income gains that can dwarf foreign assistance.

• According to the World Bank, the annual income gain to developing countries from the elimination of goods trade barriers alone (without including services trade liberalization) is \$142 billion, conservatively measured (static, not dynamic, measurement). This amount exceeds the \$80 billion in foreign economic assistance by the G-7 countries in 2005 and the current proposal of \$42.5 billion for developing country debt relief combined.

#### To realize this benefit, developing country market opening is essential.

• The World Bank also estimates that low and middle income countries would realize 50 percent of their potential economic gains from global free trade in goods, by the elimination of their own barriers.

#### Trade barriers in developing countries are higher than in developed countries.

- The IMF finds that developing country protection is 4 times higher than in high-income countries.
- The U.S. average industrial tariff is below 3 percent. Developing countries' average allowed tariff is nearly ten times higher (28.5 percent).
- The World Bank estimates that 70 percent of the burden on developing countries' manufactured exports results from trade barriers of other developing countries.
- A recent Carnegie Endowment study, showed that under a full liberalization outcome in the Doha Round, all developing countries are winners, with estimated gains for developing countries as a group ranging from \$45.6 billion to \$76 billion.

#### The potential gains from liberalization in services are enormous as well.

- Because the barriers to trade in services are extensive, the payoffs for reducing them are great. A University of Michigan study estimates that services liberalization would produce over twothirds of the global economic welfare gain from the elimination of trade barriers. These gains would go to developing and developed countries alike, with percentage gains to GNP greater for the developing countries studied.
- Services are the future of developing countries, as they are the fastest-growing component of their total GDP and the largest component of foreign direct investment.
- Services account for 61 percent of global FDI, increasing from 869 billion to 6.1 trillion from 1990 to 2005.

#### Eliminating global trade barriers could have a profound impact on poverty.

- A study by White and Anderson (2001) found that openness to trade is associated with significantly higher income growth for each income group except the top 20 percent of the population, and that the greatest effects proportionally are for the lower income groups that is, the benefit of openness is progressive.
- World Bank estimates that global free trade could lift tens of millions out of poverty. A study by the International Institute of Economics estimates that global free trade could lift as many as 500 million people out of poverty and inject \$200 billion annually into the economies of developing countries
- Columbia University Economics Professor Xavier Sala-i-Martin estimates that the number of people globally living in poverty declined by 350 million over the last three decades. China, a country that has aggressively opened its markets and expanded its trade saw poverty decline by 377 million. Poverty in Africa, on the other hand, increased by 227 million.

### Nearby markets are vital sources of potential export growth for developing countries in several regions, particularly Africa, Latin America and the Middle East.

| Countries     | Intra-Regional Exports as Percent of Exports to<br>World (2006) |
|---------------|-----------------------------------------------------------------|
| Industrial    | 68%                                                             |
| Developing:   | 47%                                                             |
| Africa        | 9%                                                              |
| Asia          | 44%                                                             |
| Europe        | 31%                                                             |
| Middle East   | 9%                                                              |
| W. Hemisphere | 19%                                                             |

### *Reducing developed and developing country trade barriers is vital to sub-Saharan Africa (SSA).*

• A recent IMF study shows that the lowering of barriers by developing countries (including SSA) is essential to SSA's realization of substantial gains from the Doha Round. Thirty-one percent of SSA exports are currently to developing countries.

### Ambitious trade liberalization by developed and developing countries yields greater economic benefits than protection of unilateral preference programs.

• A recent study by Amiti and Romalis (2006) of the IMF concludes that reducing MFN tariffs under the Doha Round will lead to improved market access for developing countries that will more that offset losses due to preference erosion. To maximize these gains, the paper recommended minimizing excluded tariff lines in agriculture.

# Preference erosion – or even the preference erosion problems associated with a particular sector or group of countries – should not limit the overall ambition of the WTO to reduce tariffs.

- Studies by the World Bank, the IMF, and universities have found that the overall impact of preference erosion is limited and the benefits of MFN tariff reduction generally outweigh preference erosion costs.
  - Only a handful of countries would be seriously affected by preference erosion. Many of these countries are island economies heavily dependent on a few exports that get preferences.
  - In particular, the preference erosion problem for many countries is largely limited to bananas and sugar, and to a much lesser extent textiles and apparel.

#### U.S. is World's Most Open Economy to Developing Countries

- The World Bank's 2005 Global Monitoring Report shows index values of import restrictiveness against low income countries of 6 for the United States, 7 for Canada, 15 for the EU and 24 for Japan (lower scores reflect fewer restrictions).
- The United States is among the least-restrictive trading economies in the world, with an average ad valorem bound tariff on all goods of 3.5 percent, compared to the 40.6 percent average of all WTO members.

| 2007 Bound Tariffs on<br>Manufactured Goods* | Simple<br>Average (%) | 2004 Bound Tariffs<br>on All Goods* | Simple<br>Average (%) |
|----------------------------------------------|-----------------------|-------------------------------------|-----------------------|
